

Asbestos Abatement and Mold Removal

Between 1920 and the mid-1970s asbestos was used in a wide range of construction applications until it was discovered that its virtually indestructible microscopic fibres caused life-threatening respiratory ailments. Its cancer-causing properties outweighed its usefulness as a low-cost, durable construction material and it was soon banned. Since then, J.W. Lindsay has devoted a team of specialists to assist in the safe removal, abatement and encapsulation of asbestos.

Mold is another substance found in many buildings which, though naturally occurring, can have devastating effects on the health of those exposed.

If your building is thought to contain asbestos or mold, our team of specialists, in partnership with leading environmental consultants, will review your site, recommend an appropriate plan of action and determine a method for its safe removal with minimal disruption to the workplace. We can also replace hazardous material with more current and safer building materials.

“The Lindsay Asbestos Removal Team delivers – their trained specialists provide professional service and have the proven ability to do the job right.”

– Roger M. Eckoldt *Urchin Property Management Inc.*
