

Today, total design flexibility is one reason metal building systems have gained more than two-thirds of the low-rise, non-residential construction market. Long-life finishes, superior thermal efficiency, low maintenance costs and wide clearspan interiors are four other good reasons for choosing a pre-engineered metal building.

Pre-engineered metal building systems can be used alone or in combination with other building materials. Lindsay has applied the benefits of this building system to a broad range of applications, from warehouses and arenas to hangars and office buildings.

At Lindsay, our 30 years of experience with metal buildings ensures you get the right building and quality construction at a very competitive price. The combination of our in-house design team, experienced field crews and quality building manufacturers make us Atlantic Canada's best single source contractor for pre-engineered metal buildings.

Among our numerous metal building options we include a unique steel building system consisting of structural wall and roof panels that eliminate the need for post-and-beam steel. This approach allows for large "column free" spans, R-40 insulation levels and clean, bright interiors.
